

## How to fit your Pure Hydration @ Home Under Sink Water Filter System

### Tools Required

- 12mm diameter drill
- Posidrive Screwdriver
- 15mm Spanner

### 1. Fit The Tap

- Find a suitable place to position the tap, ensuring that the spout is over the sink.
- Using a 12mm diameter drill, make a hole through the work surface
- Pass the blue tube that is attached to the tap through the hole and fix the tap securely as shown in the diagram below.

Ensure that you do not over tighten the nut.

- Push the black lever on the tap downwards, first removing the plastic packing piece. Insert the tap arm into the hole and push home firmly.

### 2. Fit the Filter Head

- Attach the filter head to the cupboard using the two screws provided, ensuring that there is enough room for the filter when inserted.

### 3. Fit the Saddle Valve

- Take the saddle valve that is attached to the red tube and ensure that the yellow knob is rotated fully anticlockwise. Follow the instructions included, using the correct parts for your type of pipe. The valve should be installed after the stop cock. Do not turn the adjustment knob further at this time.

### 4. Connect up your System

- Clear your work space and wash your hands before proceeding further.
- Insert the red tube that leads from the saddle valve into the left-hand side of the filter head, and the blue tube from the tap into the right-hand side. Make sure that both tubes are pushed home firmly.
- Insert the filter by pushing gently into the head and twist to lock into position.
- Turn the yellow adjustment knob clockwise as far as it will go to pierce the copper pipe. Then turn the knob anticlockwise to release water into the system. This knob can be used to control the rate of flow.

If you have any questions, please call us on 08705 820000

Check that your new Pure Hydration tap operates correctly by depressing the black lever on the tap.
